Patch management in an SME environment

Attacks involving a security gap in the Microsoft Exchange Server once again demonstrate the importance of updating your systems promptly.

Because when this update was eventually announced, this gap – already public since the beginning of March – had already been actively exploited. Experts call this a “zero day gap”, i.e. a vulnerability which is exploited before there is an update to counteract it.

Read up in our new article on “Patch Management in an SME environment” (https://www.ebas.ch/en/patch-management-in-an-sme-environment/) how you can prepare yourself for such cases, and how to react promptly and correctly.
