Playing to defeat hackers

There is an ever increasing number of hacker attacks on Swiss companies, becoming more professional all the time. It is therefore vital for employees to remain particularly alert. Play our interactive online game focusing on ransomware and find out how to react correctly in a worst case scenario.

Crime on the Internet is on the rise. “Ransomware attacks” are one of the offences regularly making headlines: Hackers use malware to remove and encrypt company data. They then ask for high sums of ransom money to decrypt them – and if you don’t pay, your stolen data might just end up in the public domain.

The game presents you with a seemingly everyday situation at the office – only for you to then become the target of cyber-criminals. The aim is to recognise the ransomware attack as quickly as possible and react accordingly. Players have the option to make various decisions in the game. If you successfully click your way through the tasks, you receive a personal assessment and further information all around the topic of protecting yourself against hacker attacks at the end of the game.
